Our goals with this course

- Learn how to build your own objective function
- Learn how to customise your own optimisation problems including using callbacks
- See some deep dives into advanced capabilities in CIL
- Support you in trying out CIL with our Jupyter notebook demos on the cloud
- Set you up to continue exploring CIL for your own data

Welcome, intro and cloud set-up 1-1:15 – Margaret

Building your own optimisation problem using the block framework– 1:15-2:30 – Jakob

- Demo: 2_Iterative/02_tikhonov_block_framework.ipynb
- Block framework example lecture
- Notebook: 4_Deep_Dives/03_htc_2022.ipynb
- **Break**

Customising your optimisation method- 2:45-3:45 – Margaret

- Demo notebook: 4_Deep_Dives/01_callbacks.ipynb
- Notebook: 4_Deep_Dives/04_preconditioner_stepsize.ipynb
- **Break**

Time to explore and discuss – 4:00-4:45 – Margaret

- Notebook: 1_Introduction/exercises/03_where_is_my_reader.ipynb
- Notebook: 4_Deep_Dives/02_phase_retrieval.ipynb
- Notebook: 3_Multichannel/02_Dynamic_CT.ipynb
- Notebook: 4_Deep_Dives/06_directional_TV.ipynb

Conclusions and further support 4:45-5 – Jakob

Your feedback from Mentimeter

● Name one thing we could improve about today's course?

9

11

More background math of some methods

More walk-thoughts if possible

More math

Maybe we could concentrate a bit more on the mathematical methods, because we haven't used these before.

More implementation details

More notebook interaction from the instructors.

more maths explanations

If felt a bit like clicking through and not really understanding

Maybe more explanation on what each operator/regularizer/functions does

Instead of covering so much content, is it possible to make a simple module to provide a test of all the things first at a bit lower difficult level and then build on it on the next day?

More indpepth comparison (plusses and minus) of CIL in comparison to other tools.

Log in to JupyterHub

- Go to: <https://tinyurl.com/cil-online-25> and write your name next to a **username** to claim it for the exercises
- Go to: <https://training.jupyter.stfc.ac.uk/>
- **Sign up with the username** you claimed and a password of your choice.
- No password reset option, so remember your password!
- Then log in with the username and password you set.
- Select the **Tomography environment** server and press "start":

Server Options

- ☐ Default: Minimal environment
For small jobs and prototyping: 2 CPUs, 1.5GB RAM and no GPU. This is the default, and will usually start in ~2 minutes. During periods of high-contention it may take up to 20 minutes to create.
- ☐ Pytorch and Tensorflow environment
This environment has pytorch and tensorflow. This configuration gives you 6 CPUs, 30GB RAM and a GPU.
- ☒ **Tomography environment**
Environment for CIL. This configuration gives you 6 CPUs, 30GB RAM, and a GPU.
- ☐ ML 2025
Environment for ML 2025. This configuration gives you 6 CPUs, 30GB RAM, and a GPU.

Start

Once you've logged in ...

The screenshot displays a web interface with two main panels. The left panel is a file explorer showing the directory structure of a project. The right panel is a launcher for various applications.

Training timetable

Day 1: Tuesday 25th March - Getting Started with CIL

Welcome, intro and cloud set-up 1-1:15 – Margaret

Building your own optimisation problem using the block framework– 1:15-2:30 – Jakob

- Demo: 2_Iterative/02_tikhonov_block_framework.ipynb
- Block framework example lecture
- Notebook: 4_Deep_Dives/03_htc_2022.ipynb
- **Break**

Customising your optimisation method- 2:45-3:45 – Margaret

- Demo notebook: 4_Deep_Dives/01_callbacks.ipynb
- Notebook: 4_Deep_Dives/04_preconditioner_stepsize.ipynb
- **Break**

Time to explore and discuss – 4:00-4:45 – Margaret

- Notebook: 1_Introduction/exercises/03_where_is_my_reader.ipynb
- Notebook: 4_Deep_Dives/02_phase_retrieval.ipynb
- Notebook: 3_Multichannel/02_Dynamic_CT.ipynb
- Notebook: 4_Deep_Dives/06_directional_TV.ipynb

Conclusions and further support 4:45-5 – Jakob

Block Framework

Go to:

`CIL-Demos/demos/2_iterative/02_tikhonov_block_framework.ipynb`

Learning Objectives:

1. Construct and manipulate BlockOperators and BlockDataContainer, including direct and adjoint operations and algebra.
2. Use Block Framework to solve Tikhonov regularisation with CGLS algorithm.
3. Apply Tikhonov regularisation to tomographic reconstruction and explain the effect of regularisation parameter and operator in regulariser.

- Go to: <https://tinyurl.com/cil-online-25> write your name next to a **username** to claim it for the exercises
- CIL Jupyter notebook server: <https://training.jupyter.stfc.ac.uk/>
- **Sign up with the username** you claimed and a password of your choice.

 **UNIVERSITY OF HELSINKI**
Department of

Test data provided and scan setup

- Four 360 degree measured sinogram data sets to generate limited-angle data from
- Reference reconstructions and segmentations

360 deg sinogram

Motivation

50 deg.

FDK
Full Range

FDK
Limited Angle

Segmentation

Diff

- See how far "**conventional**" CT pre-processing plus variational methods could go
- Use existing general purpose CIL tools as much as possible – limited time for new dev

Segmentation

- 'blind' segmentation of the test data
- Not our expertise!
- Otsu triple-threshold worked consistently for the test data at 30 degrees
- Otsu thresholded segmentation
 - Identifies signal peak
- Otsu triple-thresholded segmentation
 - Strong signal
 - Messy signal
 - Messy background
 - Strong background

Renormalization of sinogram

- Background attenuation should have a mean at zero
- Test data had an offset i.e. the normalization image was brighter than the data
 - Convert data back to I/I_0 , renormalize for a peak at 1, convert back to absorption

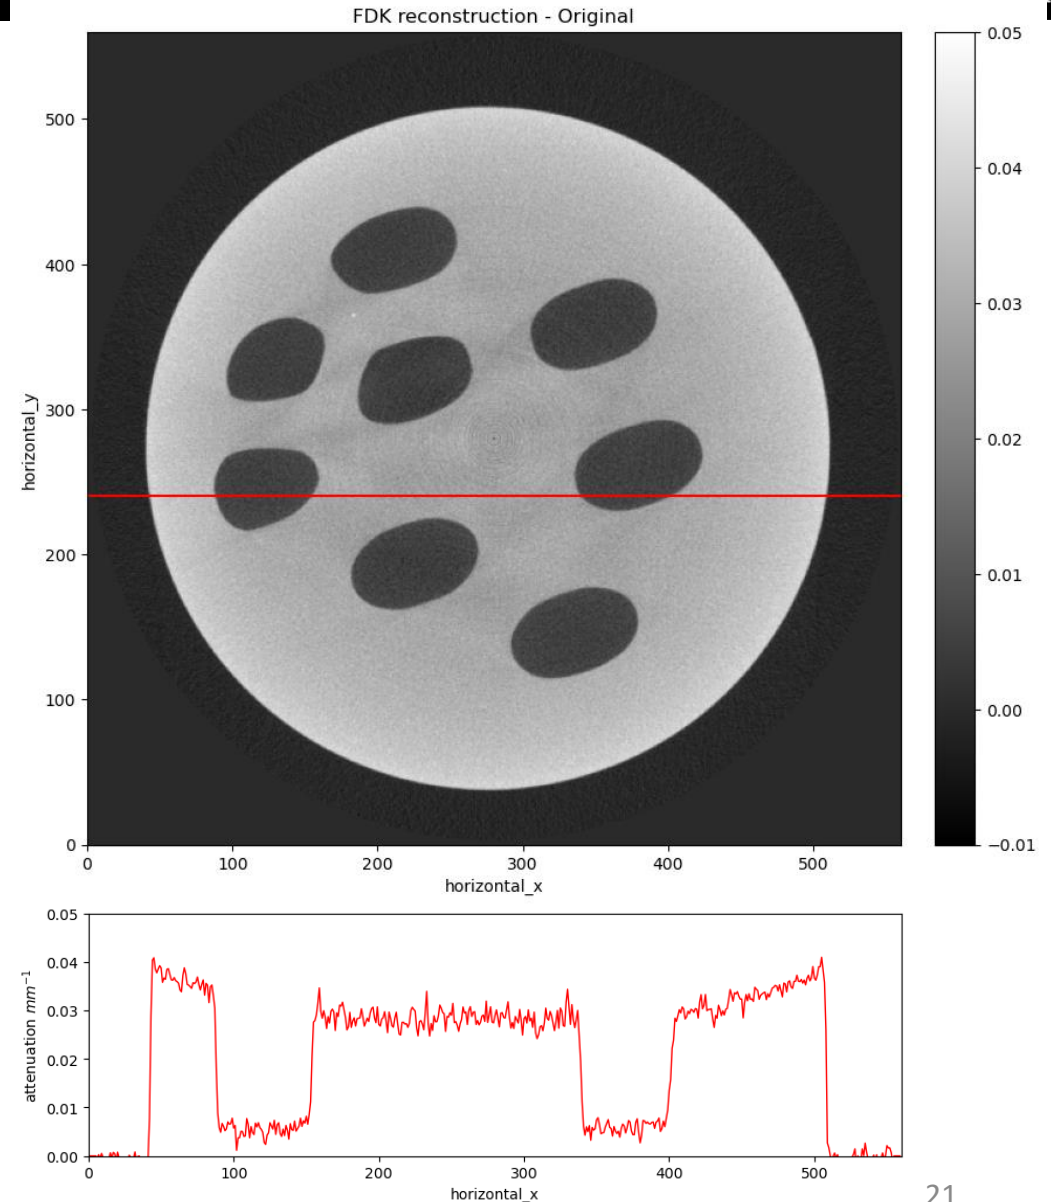

Beam hardening correction

- Lower energy rays are preferentially absorbed leading to a non-linear measurement
- Single material scan can be linearised to an effective monochromatic energy
- Correction to the linear attenuation of acrylic at 24.7 KeV, $\mu = 0.0409 \text{ mm}^{-1}$

CC BY-NC

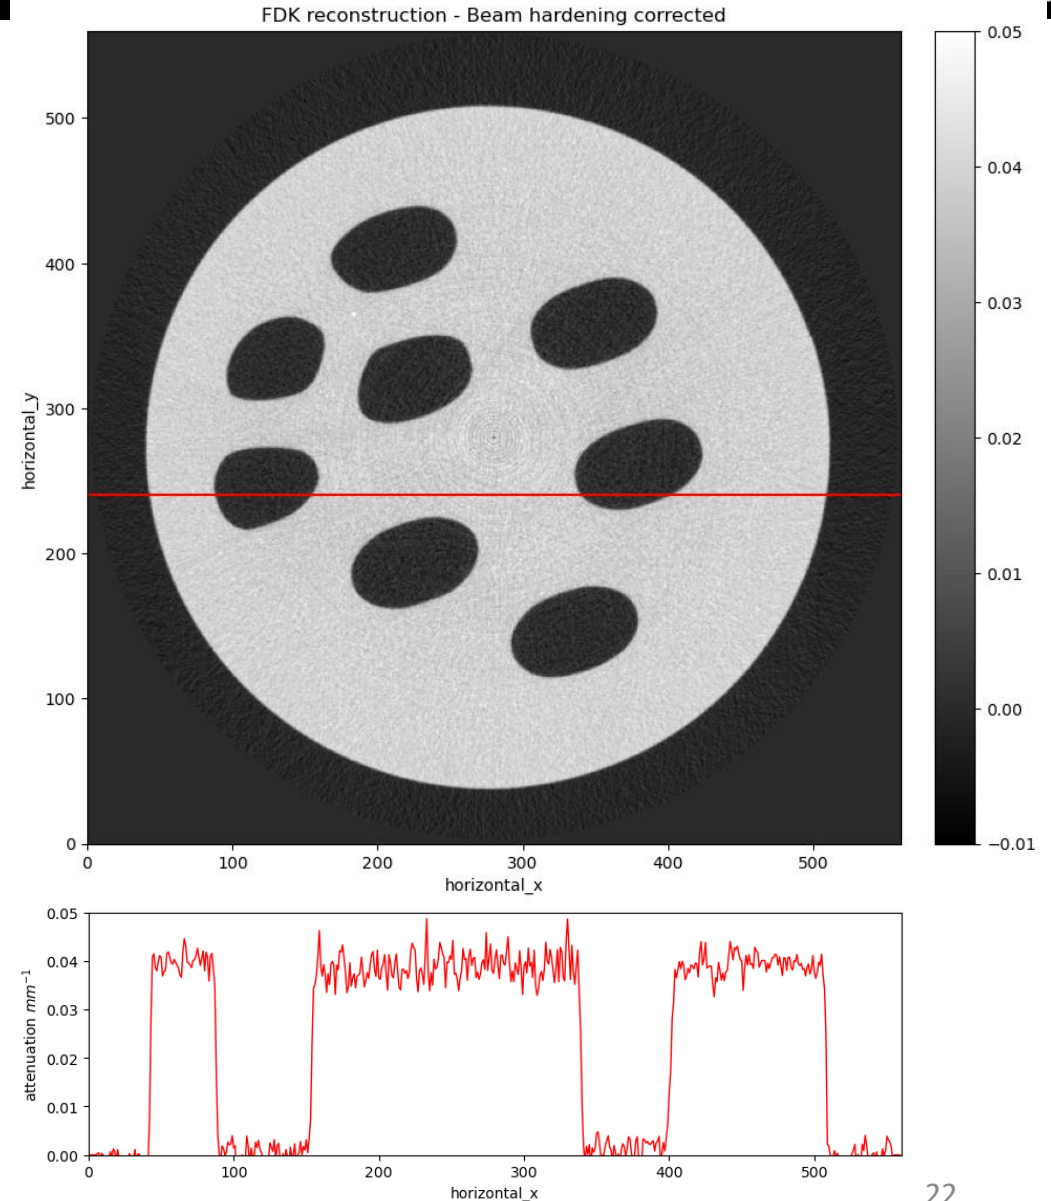

Beam hardening correction

- Lower energy rays are preferentially absorbed leading to a non-linear measurement
- Single material scan can be linearised to an effective monochromatic energy
- Correction to the linear attenuation of acrylic at 24.7 KeV, $\mu = 0.0409 \text{ mm}^{-1}$

CC BY-NC

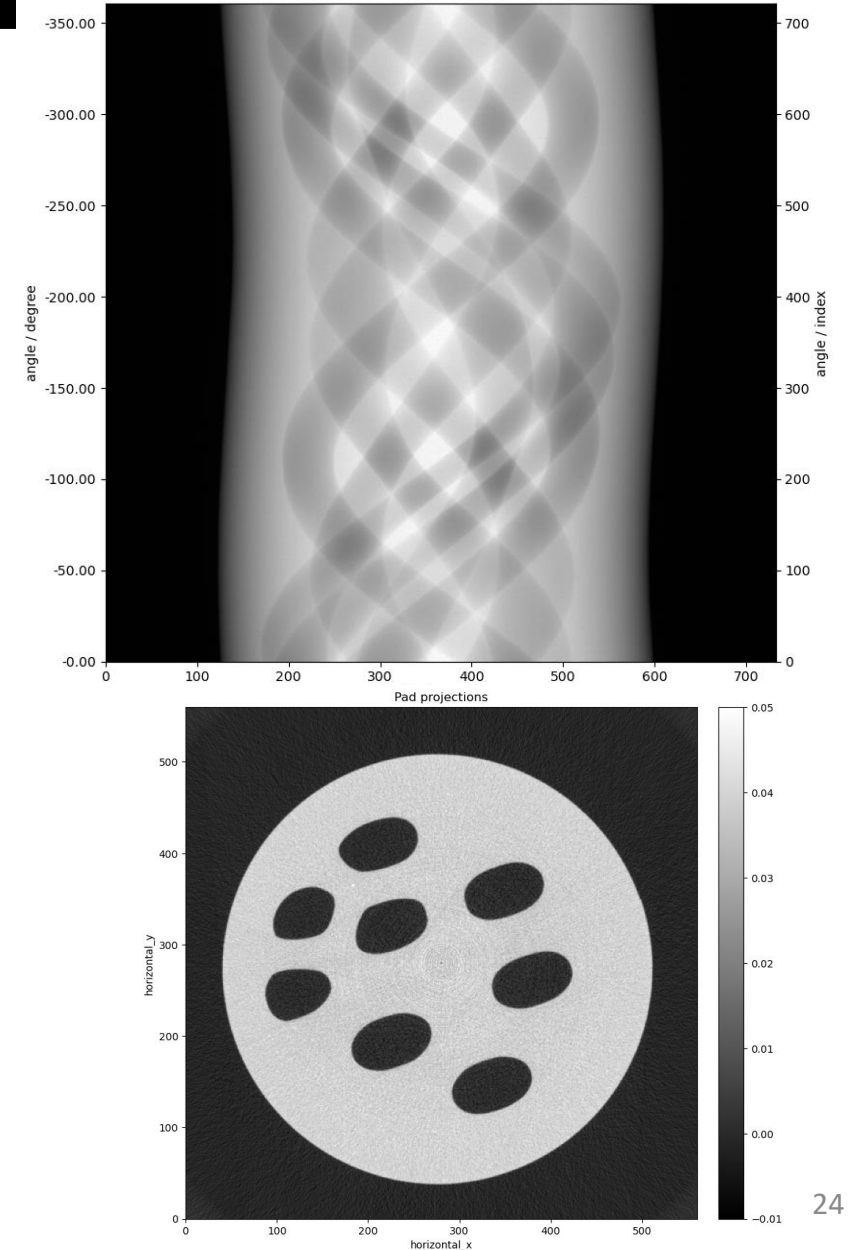

Zero-padding

- The reconstruction window extends outside the field of view
- Causes a non-zero background outside the radius of the detector
- Zero-Padding the acquisition data corrects this

Zero-padding

- The reconstruction window extends outside the field of view
- Causes a non-zero background outside the radius of the detector
- Zero-Padding the acquisition data corrects this

Reconstruction: Exploit prior knowledge

Construct optimization problem to express what we know:

- Single homogeneous material
- Sharp edges
- Object is approximately disk shaped
- Zero attenuation outside the object
- Constant value of 0.0409 mm^{-1} inside the object
- Edges perpendicular to projection angles are the most difficult (micro-local analysis)

Prior knowledge: homogeneous material with sharp edges

FDK
Full Range

$$\min_{\mathbf{u}} \quad a_1 \|\mathbf{A}\mathbf{u} - \mathbf{b}\|_2^2 + a_2 \text{ITV}(\mathbf{u})$$

Score: 0.713

FDK Score: 0.430

Reconstruction

Segmentation

Diff

Prior knowledge: approximately disk shaped

Limited angle FDK

Gradient Magnitude

Disk

I.D. Coope *Circle fitting by linear and nonlinear least squares in 2D*
<https://link.springer.com/article/10.1007/BF00939613>

Disk shape with known attenuation as constraints

$$\begin{aligned}
 \min_{\mathbf{u}} \quad & a_1 \|\mathbf{A}\mathbf{u} - \mathbf{b}\|_2^2 + a_2 \text{ITV}(\mathbf{u}) \\
 \text{s.t.} \quad & \mathbf{0} \leq \mathbf{u} \leq v\mathbf{m}
 \end{aligned}$$

Score: 0.919

Anisotropic TV

- Blurred edges along central projection direction
- Rotate to align with coordinate axis
- Apply single-directional TV to encourage edges in blurred direction
- Remember to check convergence!
- Rotate back

LS + ITV + mask + ATV

$$\min_{\mathbf{u}} \quad a_1 \|\mathbf{A}\mathbf{u} - \mathbf{b}\|_2^2 + a_2 \text{ITV}(\mathbf{u}) + a_3 \text{ATV}_x(\mathbf{u})$$

$$\text{s.t.} \quad \mathbf{0} \leq \mathbf{u} \leq v\mathbf{m} \quad \text{Score: 0.934}$$

LS + ITV + mask + ATV (converged!)

$$\begin{aligned}
 \min_{\mathbf{u}} \quad & a_1 \|\mathbf{A}\mathbf{u} - \mathbf{b}\|_2^2 + a_2 \text{ITV}(\mathbf{u}) + a_3 \text{ATV}_x(\mathbf{u}) \\
 \text{s.t.} \quad & \mathbf{0} \leq \mathbf{u} \leq v\mathbf{m}
 \end{aligned}$$

Score: 0.973

Primal Dual Hybrid Gradient (PDHG) method in CIL

CIL offers a range of optimization algorithms, incl GD, FISTA, ADMM and **PDHG**:

$$\min_{\mathbf{u}} \quad f(\mathbf{K}\mathbf{u}) + g(\mathbf{u})$$
$$\text{where} \quad f(\mathbf{K}\mathbf{u}) = \sum_i f_i(\mathbf{K}_i\mathbf{u})$$

Rewrite our optimization problem for PDHG:

$$\min_{\mathbf{u}} \quad a_1 \|\mathbf{A}\mathbf{u} - \mathbf{b}\|_2^2 + a_2 \|\mathbf{D}\mathbf{u}\|_{2,1} + a_3 \|\mathbf{D}_{\mathbf{x}}\mathbf{u}\|_1 + \chi_{[\mathbf{0}, v\mathbf{m}]}(\mathbf{u})$$

$$f = \begin{pmatrix} a_1 \|\cdot - \mathbf{b}\|_2^2 \\ a_2 \|\cdot\|_{2,1} \\ a_3 \|\cdot\|_1 \end{pmatrix} \quad \mathbf{K} = \begin{pmatrix} \mathbf{A} \\ \mathbf{D} \\ \mathbf{D}_{\mathbf{x}} \end{pmatrix} \quad g = \chi_{[\mathbf{0}, v\mathbf{m}]}$$

Solving with CIL – "near-math" syntax

$$f = \begin{pmatrix} a_1 \|\cdot - \mathbf{b}\|_2^2 \\ a_2 \|\cdot\|_{2,1} \\ a_3 \|\cdot\|_1 \end{pmatrix}$$

```
F = BlockFunction( a1*L2NormSquared(data),  
                  a2*MixedL21Norm(),  
                  a3*L1Norm() )
```

$$\mathbf{K} = \begin{pmatrix} \mathbf{A} \\ \mathbf{D} \\ \mathbf{D}_x \end{pmatrix}$$

```
K = BlockOperator( ProjectionOperator(ig, ag),  
                  GradientOperator(ig),  
                  FiniteDifferenceOperator(ig, 'horizontal_x') )
```

$$g = \chi_{[\mathbf{0}, v\mathbf{m}]}$$

```
G = IndicatorBoxPixelwise( lower=0.0,  
                          upper=v*m )
```

$$\min_{\mathbf{u}} f(\mathbf{Ku}) + g(\mathbf{u})$$

```
algo = PDHG( initial=ig.allocate(0.0),  
            f=F,  
            g=G,  
            operator=K)  
algo.run(2000)
```

Results on even fewer angles...

30 deg.

Ideas to explore if more time

- Improved segmentation – area we spent least time
- Enforce acrylic value in outermost circular band
- Combine with L1-norm sparsity regulariser to force zero values

Time to explore in break out rooms

Demo: CIL-Demos/demos/2_Iterative/02_tikhonov_block_framework.ipynb

1. Construct and manipulate BlockOperators and BlockDataContainer, including direct and adjoint operations and algebra.
2. Use Block Framework to solve Tikhonov regularisation with CGLS algorithm.
3. Apply Tikhonov regularisation to tomographic reconstruction and explain the effect of regularisation parameter and operator in regulariser.

Explore: CIL-Demos/demos/4_Deep_Dives/03_htc_2022.ipynb

See examples of:

- incorporating prior knowledge of a problem in a variational regularisation framework
- utilising the flexibility and near-math syntax of the CIL optimisation toolkit to prototype different reconstruction objectives
- the CIL Block Framework and PDHG optimisation algorithm

- Go to: <https://tinyurl.com/cil-online-25> write your name next to a **username** to claim it for the exercises
- CIL Jupyter notebook server: <https://training.jupyter.stfc.ac.uk/>
- **Sign up with the username** you claimed and a password of your choice.

Summary and questions

We have seen:

- How to incorporate prior knowledge of a problem in a variational regularisation framework
- How CIL can be used to flexibly prototype different reconstruction objectives
- How to use the block framework in CIL to build up more complex optimisation objectives

Time to explore

Notebook: 1_Introduction/exercises/03_where_is_my_reader.ipynb

- Load and investigate a dataset stored as a tiff using `TIFFStackReader`
- Create the CIL geometry using `AcquisitionGeometry.Create_Cone2D`
- Combine the data and geometry to form an `AcquisitionData`
- Find the Centre of rotation to complete the data geometry description

Notebook: 4_Deep_Dives/02_phase_retrieval.ipynb

- Intro to phase contrast imaging, propagation based phase contrast and phase retrieval
- Demonstration of the CIL Paganin Processor and Generalised Paganin method in CIL
- Demonstration of the effect of propagation distance on phase retrieval methods in CIL

Notebook: 3_Multichannel/02_Dynamic_CT.ipynb

- Create a geometry for dynamic tomographic tomographic data
- Compare FBP reconstructions for every time-channel with spatio-temporal total variation
- Introduction to directional total variation

Notebook: 4_Deep_Dives/06_directional_TV.ipynb

- Introduce the dTV regulariser
- Demonstrate the dTV regularisation using the CCPi regularisation toolkit, seeing examples of over and under regularisation
- Use the CIL BlockFramework and PDHG to define and minimise a CIL objective function for using dTV for denoising.

- 001 – Multibang regularisation
- 002 – Deblurring with CIL
- 003 – 1D integral inverse problem
- 004 – Dynamic CT example
- 005 – Dynamic MR example (with SIRF)
- 006 – CT simulation with gVXR
- 007 – Hyperspectral regularisation
- 008 - Poisson noise models for the data discrepancy term
- 009 – Offset CT reconstruction of an apple
- 010 – Bruker Skyscan reader and reconstruction
- 011 – Phase contrast Exciscope data
- 012 – Wavelet sparsity control regularization
- 013 – anisotropic regularization for FILD measurements
- 014 – GVXR simulation and CIL CPU reconstruction
- One more currently in review!

CCPi = Collaborative Computational Projects in Tomographic Imaging

UK Network of
expertise in key
computational
research fields

NETWORK

CCP's foster
exchange by
organising
workshop, training,
conferences ...

EXCHANGE

Enable large-scale
scientific software
development,
maintenance and
distribution.

SOFTWARE

Long term funding
by EPSRC,
transitioning to
CoSeC

FUNDING

Computational Science Centre for Research Communities

Novel sources
novel detector
technology that are
faster, larger and energy
sensitive

DATA SIZE

to help automate
tasks and obtain
better images and
quantification

AI

data access,
storage and
reproducibility

FAIR

Findable, Accessible, Interoperable
and Reusable

Develop and
maintain software
Foster community

NETWORK

Increased energy efficiency using CPU/GPU, simulation, state of the art mathematical optimisation methods

DATA SIZE

Enable efficient integration with AI tools like PyTorch

AI

standardisation initiatives including NoCTURN and PSDI

User show and tell and user drop-in

- Every other Thursday 1-2pm UK, online
- Two informal talks from users and/or CIL developers
- Followed by user drop-in session (2pm-2:30pm) – come ask your CIL and tomography questions!
- Advertised on Discord and on email list.

**Next one:
10th April**

<https://ccpi.ac.uk/events/ccpi-show-tell-and-user-support-drop-in/>

Tell us about your work!

If you publish or present - or win a prize - for work done using CIL, please:

- Tell us about it – tomography@stfc.ac.uk
- Give an (informal) talk at our show and tell
- Cite CIL --> citations help us secure funding for more CIL!

Citing CIL

If you use CIL in your research, please include citations to **both** the software on Zenodo, and a CIL paper:

E. Pasca, J. S. Jørgensen, E. Papoutsellis, E. Ametova, G. Fardell, K. Thielemans, L. Murgatroyd, M. Duff and H. Robarts
(2023)

Core Imaging Library (CIL)

Zenodo [software archive]

<https://github.com/TomographicImaging/CIL>

DOI: <https://doi.org/10.5281/zenodo.4746198>

Where to go from here?

Use CIL

- In your work
- Teaching, etc.
- Please cite CIL

Tell others

- Students, postdocs, professors, ...
- (Tell **us** if you do **not** see yourself using CIL, and why)

Contribute – on GitHub or by email

- Bug reports, documentation suggestions, etc.
- Feature requests
- Bug fixes
- New features

Collaborate – and publish – with us

- We can help set up CIL for your problem
- Integrate new tools, algorithms, etc. in CIL
- Collaborations drive new code development

CIL community

CIL “Bring Your Own Data” Hackathon Isaac Newton Institute Cambridge, UK – Mar 2023

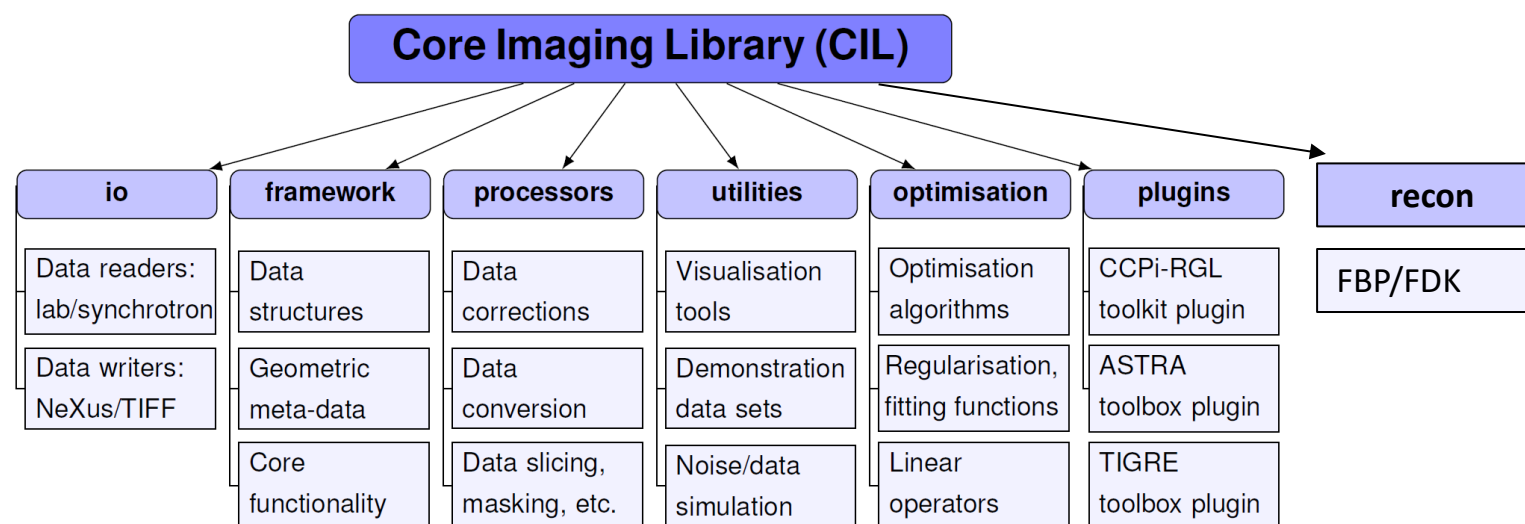

First CIL User Meeting Rutherford Appleton Laboratory Harwell, UK – Nov 2023

Who is CIL for?

- CT experimentalists
 - **Optimised** standard algorithms for large data
 - Batch processing
 - To utilise reconstruction algorithms for **poor data quality** or to handle novel imaging modalities
- Image processing specialists
 - to easily implement new reconstruction algorithms
 - **assess** them against existing ones.

CIL Module Structure and Contents

Jørgensen et al. 2021: *Core Imaging Library - Part I: a versatile Python framework for tomographic imaging*, Phil. Trans. R. Soc. A, **379**, 20200192: <https://doi.org/10.1098/rsta.2020.0192>

The **cil.plugins** module contains wrapper code for other software and third-party libraries that need to be installed separately to be used by CIL.

 [Edit on GitHub](#)

Welcome to CIL's documentation!

The aim of this package is to enable rapid prototyping of optimisation-based reconstruction problems, i.e. defining and solving different optimization problems to enforce different properties on the reconstructed image, while being powerful enough to be employed on real scale problems.

Firstly, it provides a framework to handle acquisition and reconstruction data and metadata; it also provides a basic input/output package to read data from different sources, e.g. Nikon X-Radia, NeXus.

Secondly, it provides an object-oriented framework for defining mathematical operators and functions as well a collection of useful example operators and functions. Both smooth and non-smooth functions can be used.

Further, it provides a number of high-level generic implementations of optimisation algorithms to solve generically formulated optimisation problems constructed from operator and function objects.

Demos and Examples

A number of demos can be found in the [CIL-Demos](#) repository.

For detailed information refer to our articles and the repositories with the code to reproduce the article's results.

1. Jørgensen JS et al. 2021 Core Imaging Library Part I: a versatile python framework for tomographic imaging <https://doi.org/10.1098/rsta.2020.0192> . Phil. Trans. R. Soc. A 20200192. The code to reproduce the article results.  [TomographicImaging/Paper-2021-RSTA-CIL-Part-I](#)
2. Papoutsellis E et al. 2021 Core Imaging Library - Part II: multichannel reconstruction for dynamic and spectral tomography <https://doi.org/10.1098/rsta.2020.0193> Phil. Trans. R. Soc. A 20200193. The code to reproduce the article results.  [TomographicImaging/Paper-2021-RSTA-CIL-Part-II](#)

Cite this work

If you use this software please consider citing one or both of the articles above.

Filtered Back Projection (FBP)

Pros

- Fast as based on FFT and backprojection
- Few parameters
- Typically works very well
- Reconstruction behaviour well understood

Cons

- Number of projections needed proportional to acquisition panel size
- Full angular range required (**limited angle** problem)
- Modest amount of noise tolerated
- Fixed scan geometries
- Cannot make use of prior knowledge such as non-negativity

Algebraic Iterative Methods

regularising by number of iterations

CGLS

$$u^* = \arg \min_u \|Au - b\|_2^2$$

Typically 10s of
iterations

SIRT

As above and allowing
lower and upper bounds
on pixel values, here
Non-negative and ≤ 0.9

Typically 100s of
iterations

Core Imaging Library for CT and other inverse problems

```
data = ZEISSDataReader(filename).read()
data = TransmissionAbsorptionConverter()(data)
show_geometry(data.geometry)
recon = FDK(data).run()
show2D(recon)
```

- Data readers/writers
- Pre-processing tools
- Image reconstruction
- *Near math* optimisation syntax
- Visualisation
- 2D, 3D and 4D data
- TIGRE and ASTRA backend

ccpi.ac.uk/CIL

What is Total Variation?

- Measures variation of an image
- Sum of gradient magnitude image
$$TV(u) = \sum_j \|D_j u\|_2$$
- Prior: few homogeneous regions with simple boundaries
- Quite successful in tomography, in particular for reduced data
